

Be Your Authentic Self

As a junior in high school, Ashley Godin learned about biomedical engineering when she attended an Engineering Interest Day at Purdue University. Because she found the application of math, science, and other engineering disciplines to the human body fascinating, Ashley pursued a biomedical engineering degree at the University of Michigan. When it came time to transition to the workforce, Ashley took a leap into the world of electrical engineering with National Instruments (NI), an automated test equipment and engineering company. Her decision was based on NI’s leadership program, the promise of a collaborative and hard-working but very fun company culture, and a chance to move half-way across the country by herself (“scary, but exciting!”).

As a Senior Applications Engineer, Ashley partners with customers to understand their challenges. She creates customized solutions using radio frequency and wireless communication products. NI makes these products for customers to more accurately and quickly test and measure their own products. Ashley states, “Whether you’re making the high-powered base station for broadcasting data, the cell phone that has to operate on the 5G New Radio standard, or the power amplifier within the phone that needs to operate more efficiently, you’re facing challenges you haven’t seen before; these products represent my customers.”

Ashley does not envision herself as the typical engineer. An enthusiastic dancer and dance instructor, she credits communication, customer focus, collaboration, empathy, and trust building as the reasons she is successful in her role. Throughout school, Ashley was very involved with student organizations and leadership positions where she learned skills that transferred to the workplace. She believes “there’s truly always room to grow and improve!”

Breaking the Mold

Ashley Godin
*Senior Application Engineer
National Instruments*

“Be unapologetically yourself – I don’t come close to fitting that old mold of what an engineer is supposed to be like because there never should have been a mold in the first place.”
