

Sustainable Packaging

Boston Scientific is a manufacturer of medical devices used in interventional medical specialties. Grace Milton designs packaging that:

1. protects medical devices
2. provides easy-to-open, functional performance

The main purpose of packaging is to protect the product inside, but what makes packaging exciting is providing a design that helps the end user. Everyone has used frustrating packaging, but when you find that package that's not only interesting to look at, but has a clever or easy-opening feature, you never forget it. Grace says, "The medical device industry is a great industry to be in because the goal is to increase our physicians' efficiency and ensure the products are sterile and arrive in perfect condition. By helping physicians, Boston Scientific is helping patients."

Teamwork, communication, collaboration, and project management are necessary skills in any career. As an engineer, you need to have a balance between technical knowledge and professional skills. These professional skills are required so you can convey your ideas and attributes to other engineers or business team members. It is important to work with others to create your ideas, accomplish your goals, and finish the project within your projected timeline. Project management is another key skill that helps an engineer stay organized and prioritize goals. Finding a balance takes time and won't happen instantly, but the more experience you gain and the more situations you are placed in, the more you will become a well-rounded engineer!

Engineers Changing the World

Grace Milton
Packaging Engineer

"As a packaging engineer, I get to be the one driving sustainability initiatives; I inform employees and consumers of the impact a package design has on our sustainability efforts, not only as a company, but as people who care about the future of our planet."
