

Artificial Intelligence in Computer Science

Dr. May Casterline is a data scientist/image scientist/software developer with a background in satellite and airborne imaging systems. Her research interests include deep learning, hyperspectral and multispectral imaging, innovative applications of machine learning approaches to remote sensing data, multimodal data fusion, data workflow design, high-performance computing applications, and creative software solutions to challenging geospatial problems.

When she first went to college, she was pursuing a degree in Photography. It wasn't until she got to college that she found an interest in programming:

"While in my first year of school I took two pivotal classes, Materials and Processes of Photography and an Introduction to Programming course. I immediately fell in love with these classes and the curriculum clicked. The logic of programming made innate sense to me, and learning about the science behind image formation was enthralling. Photography quickly became a hobby versus a passion, and I decided to switch majors to Imaging Science."

As a Senior Solutions Architect at NVIDIA, Dr. Casterline works with both industry and government to help developers, engineers, data scientists, and analysts integrate artificial intelligence (AI) and graphics processing units.

"My work has provided me the opportunity to work on several fascinating projects, including generating rapid, high-accuracy imagery and maps during the earthquake that struck Haiti in 2010, helping the Department of Energy model power-generating facilities in support of nuclear nonproliferation, and advising the government on how to modernize infrastructure to support artificial intelligence applications to maintain our competitive edge in the world and keep our country safe."

May's Journey

May Casterline
Senior Solutions Architect

"The best advice I ever got was from my advisor in college. He told me to always say what I think, even if I'm not in the position of authority. People may not agree or like what you have to say, and you must do it respectfully, but you have to have the courage to say what you think if you ever want to help effect change or growth."
